

The Robin Clevett Hinge jig

ROBIN CLEVETT

Thank you for purchasing this Hinge Jig, I hope you enjoy the simplicity of this jig and enjoy using it too, check my channel for some videos where I use this jig

Search Robin Clevett on YouTube

This is the Robin Clevett hinge jig suitable for the most commonly used door hinges in the UK

The hinges are available from all ironmongery suppliers large and small

The hinge jig needs no skill to set up simply mark your hinge position clamp over the mark exactly and using a flush template cutter and small router remove the material

Always position the router and switch on when secure in the Jig to avoid damaging the edges

Finish with a chisel or corner chisel

If you are doing several doors, make a simple storey stick or rod to mark your hinge positions in the location you prefer and then use this device to mark all doors and frames

The jig has been designed to work on standard door linings prior to stops and architraves being fitted (in the case of new builds etc)

Notes to users

Many of the hinges will have a slight variation in their manufactured dimensions we have made our Jig to suit an average of these hinges, therefore the exact fit of the recess created when routed should allow for these small differences. From our development and research we discovered that even hinges from the same packet differed.

Suggestion

You can make fine adjustments to the jig by simply using a block and sandpaper to remove a small amount from the side of the jig if you find your particular choice of hinge is tight

Trend Router cutter part number C121BX1/4TC available in my Amazon Store
There are several other brands of Flush top bearing router cutters that will work too

Many thanks

Robin Clevett
